Cognitive Behavioral Therapy - An Overview

February 2020 update
Today’s Facilitator

Lisa Kugler, PsyD.

• Master of Counseling Psychology (1999)
• Doctor of Psychology (2007)
• Experienced therapist for adults, adolescents and children in various settings
• Clinical leadership with Beacon since 2013
Learning Objectives:

1. Discuss the history of Cognitive Behavioral Therapy (CBT)
2. Identify the key principles of CBT
3. Recognize common thinking errors
4. Describe the basic techniques that are utilized for various conditions with CBT
Agenda

01 What is CBT
02 History of CBT
03 How does CBT work
04 Class Exercises
05 Looking Ahead
06 References
Chapter 01

What is Cognitive Behavioral Therapy?
Basics of Cognitive Behavioral Therapy (CBT)

• CBT is a type of psychotherapeutic treatment that helps people learn how to identify and change maladaptive thought patterns that have a negative influence on behavior and emotions.
## CBT Has Many Applications

### Mental Health Concerns
- Anxiety
- Mood Disorders
- Schizophrenia
- Eating Disorders
- PTSD
- Addiction

### Physical Health Concerns
- Coping with Chemotherapy
- Chronic Pain
- New Diagnoses
- Chronic Fatigue
- Insomnia

### Lifestyle Issues
- Assertiveness
- Diet
- Exercise
- Social Isolation
- Grief
- Anger Management
Research Supports CBT as Successful Treatment

• CBT found to be most helpful in treating:
  o Anxiety disorders
  o Somatoform disorders
  o Bulimia
  o Anger control problems
  o General stress

• CBT showed higher response rates in 7 out of 11 studies.
  o Only one review reported that CBT had lower response rates than comparison treatments (Hoffman, 2012)
Effectiveness of Treatment Modalities in Adults with Depression and Anxiety

MedCircle (2020)

- CBT alone: 50 - 75%
- Medication alone: 50 - 75%
- CBT & Medication combined: 75 – 90%

Chapter 02

History of Cognitive Behavioral Therapy
Origins of Cognitive Behavioral Therapy

• Linking thoughts, feelings, and behaviors was first initially discussed in the *Handbook of Epictetus*
  
  o Short manual of stoic ethical advice compiled by Arrian, a 2nd-century disciple of the Greek philosopher Epictetus
  
  o Shows the way to achieve mental freedom and happiness in all circumstances

• This is the essence of Cognitive Behavioral Therapy
“Men are disturbed not by things, but by the view which they take of them”

-Epictetus in the Enchiridion
Development of Cognitive Behavioral Therapy

• Aaron Beck developed CBT in 1960’s

• Used CBT to address depression

• Observation:
  - Depressed individuals generally have a negative bias about themselves and a negative interpretation of life events.
Video: Aaron Beck on the Importance of CBT
Chapter 03

How does Cognitive Behavioral Therapy Work?
The Cognitive Model

Situation → Thought → Emotion → Behavior

- something happens
- the situation is interpreted
- a feeling occurs as a result of the thought
- an action in response to the emotion
Primary Principles of Cognitive Behavioral Therapy

- Psychological disorders are characterized by *maladaptive thinking* derived from *maladaptive beliefs*

- Improvement is seen by
  - Modifying maladaptive thinking = short term results
  - Modifying maladaptive beliefs = long term results

- “Talking Therapy”
  1. Individual identifies negative ways of thinking or feeling during problem situations
  2. Therapist helps show the connections between thoughts and feelings
  3. Question thoughts / beliefs: good self talk vs. bad self talk
  4. Generate healthy alternatives
The ABC’s of CBT

<table>
<thead>
<tr>
<th>A</th>
<th>Activating Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Belief</td>
</tr>
<tr>
<td>C</td>
<td>Consequence</td>
</tr>
<tr>
<td>D</td>
<td>Dispute</td>
</tr>
<tr>
<td>E</td>
<td>Effect</td>
</tr>
</tbody>
</table>
Exercise 1: Examine Your Thinking Patterns

• Write down the last time you:
  o Felt angry
  o Felt upset

• For each of these, write down your thoughts at the time of the incident

• What did you notice?
Exercise 1: Discussion

• Were you more critical of others when you were angry?

• Were you more critical of yourself when you were upset?
### Common Thinking Errors

<table>
<thead>
<tr>
<th>Mind Reading</th>
<th>Fortune Telling</th>
<th>Catastrophizing</th>
<th>Labeling</th>
<th>Discounting Positives</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Assuming you know what people think with little evidence</td>
<td>• Predicting that things will get worse or that there is danger ahead</td>
<td>• Belief that what has happened/will happen will be so awful and unbearable that you won’t be able to stand it</td>
<td>• Assigning global negative traits to yourself and others</td>
<td>• Trivialize positives that you or others attain</td>
</tr>
</tbody>
</table>

### Common Thinking Errors

**Negative Filter**
- Focus is almost exclusively on the negatives and seldom notice the positives

**Overgeneralizing**
- Perceive a global pattern of negatives on the basis of a single incident

**Dichotomous Thinking**
- Viewing yourself, events, or other people, in “all or nothing terms” - either perfect or a total failure

**“Should”s**
- Interpreting events in terms of how things should be rather than simply focusing on what is
Common Thinking Errors

Blaming
• Focus on the other person as the source of your negative feelings & refuse to take responsibility for changing yourself

Unfair Comparisons
• Interpreting events in terms of standards that are unrealistic & finding yourself inferior in comparison

Regret Orientation
• Focusing on the idea that you could have done better in the past, rather on what you can do better now

What If?
• Continuing to ask a series of questions about “What if” something happens and fail to be satisfied with any of the answers
Common Thinking Errors

<table>
<thead>
<tr>
<th>Emotional Reasoning</th>
<th>Inability to Disconfirm</th>
<th>Judgment Focus</th>
<th>Personalizing</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Letting your feelings guide your interpretation of reality</td>
<td>• Rejecting any evidence or arguments that might contradict your negative thoughts</td>
<td>• Viewing yourself, others and events in terms of evaluations of good bad or superior inferior</td>
<td>• Attributing a disproportionate amount of the blame to yourself for negative events</td>
</tr>
</tbody>
</table>
Exercise 2: Identify Your Thinking Errors

• Think of a behavior that you tried to change, and then reverted back to?
  o Weight change
  o Smoking
  o Exercise

• What did you tell yourself to help keep you motivated?

• What did you tell yourself when you reverted back to previous behaviors?
We Identified them, Now What?

<table>
<thead>
<tr>
<th>Challenge Thinking Patterns:</th>
<th>Include Behavioral Changes:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mood Monitoring</td>
<td>Social Skills</td>
</tr>
<tr>
<td>Problem Solving</td>
<td>Relaxation Skills</td>
</tr>
<tr>
<td>Automatic Thoughts Sheets</td>
<td>Affective Education</td>
</tr>
<tr>
<td>Coping Cards</td>
<td>Progressive Muscle Relaxation</td>
</tr>
<tr>
<td>Cognitive Restructuring</td>
<td>Activity Monitoring</td>
</tr>
</tbody>
</table>
Exercise 1- Part 2: Change your Thinking Patterns

• Go back to the examples you had for the first exercise

• Can you think of other ways to view the situations that made you angry or upset?
  o How can you create a different emotional response?
Chapter 04

Looking Ahead
There’s an App for That!

- CBT is being utilized in apps to support individuals outside of the therapy session
MoodNotes

**KEEP your mood diary**

**FIND your mood patterns**

**IDENTIFY your thinking traps**

**BRING new perspectives to situations**

CBT via Telehealth

• With COVID-19 many mental health services have moved to telehealth

• CBT has been shown to be effectively delivered via telehealth

• After COVID has subsided, we continue to expect there will be many services being delivered by telehealth
CBT may not be as effective if:

- The therapist does not encourage the individual to develop new replacement thoughts
- The patient is not ready to “do the work”
- CBT does not address wider systems or family issues that can significantly impact an individual’s health and wellbeing
- Those with significant intellectual disability or very young children may not be able to identify and modify thinking patterns
Cognitive Behavioral Therapy was primarily developed by Aaron Beck in the 1960’s

CBT is an evidence based therapy that explores how a person’s thoughts & feelings about a situation influence their reactions and behaviors

CBT highlights for individuals their problematic thinking patterns and ways to challenge them

CBT has been shown to be effective on various diagnoses and conditions
